

BIOSECURITY & BIOSAFETY

BIOSECURITY TAKES MANY FORMS

Biological threats are real and inhabit many forms. Whether it is confronting bioterrorism, securing biological materials, improving laboratory safety, or building the capacity of health researchers, we are committed to ensuring that a health threat anywhere does not become a health threat everywhere.

A COMMITMENT TO LOCAL SOLUTIONS

Improving biosecurity and enhancing biosafety practices is an essential part of improving global health. Our biosecurity and biosafety programs are designed to build the local capacity of biological scientists and researchers so that they can safely conduct their research and contribute to making the world a safer, healthier place.

HOW WE DO IT

SUPPORTING LOCAL BIOSAFETY ASSOCIATIONS

One of the most important aspects of biosafety is the capacity of local and regional health institutions. We work with local biosafety associations to provide them with the training and support they need to design effective policies that create lasting and sustainable cultures of biosafety.

MAKING LABS SAFER

Laboratory research is an essential component to understanding infectious diseases. We work to ensure that laboratories around the world are properly equipped and maintained to conduct effective health research and properly secure hazardous biological material.

BUILDING EXPERTISE IN BIOSECURITY

We coordinate and support trainings that educate scientists, policymakers, and first responders on the importance of biosecurity and biosafety. Our work aims to create leaders that can further the cause of biosecurity not only in their home countries, but throughout local regions and the world.
